Fetal Alcohol Spectrum Disorders (FASDs) result from prenatal exposure to alcohol. Lifelong effects may include a range of physical, mental, behavioral and/or learning problems.

The American Academy of Pediatrics supports the early identification and care coordination of children who have one of the FASDs. Pediatricians, pediatric nurse practitioners, family physicians and health professionals play a frontline role by considering prenatal alcohol exposure when assessing children with neurocognitive and/or behavioral concerns, and those with suggestive physical findings.

The FASD Toolkit at aap.org/fasd is a one-stop clinical resource of compiled tools that range from clinical decision support and communication aids to practice management guides that support quality care in the medical home.

Early recognition leads to better outcomes.

The FASD Toolkit is available at aap.org/fasd
