AAP ZIKA ECHO

(EXTENSION FOR COMMUNITY HEALTHCARE OUTCOMES)
**HOUSEKEEPING ITEMS**

- For educational and quality improvement purposes, this ECHO session will be recorded.
- Project ECHO® collects participation data for each ECHO session. This data allows Project ECHO to measure, analyze, and report on the ECHO movement’s reach. Data is used in reports, on maps and visualizations, for research, for communications and surveys, for data quality assurance activities, and for decision-making related to new initiatives.
- To protect patient privacy, please do not provide any (PHI) protected health information.
- Please mute your microphone when not speaking. If you have video capability, please enable it.
- There is a chat function in Zoom that may be used to send messages to the group. For IT help, please chat to the AAP Admin and we will assist you.
ACKNOWLEDGMENTS

This project is supported by the Maternal and Child Health Bureau, Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) under grant number U43MC09134
Follow Up Care for Infants Born to Women with Possible Zika Virus Exposure During Pregnancy

Margaret Fisher, MD, FAAP

Presented June 4, 2018
DISCLOSURES

- I have no financial disclosures.
**Follow Up Care for Infants with Evidence of Zika Virus Infection**

- CDC has issued clinical management recommendations for infants with evidence of Zika virus infection, both with and without apparent birth defects, to ensure careful screening and monitoring of infant development.
Update: Interim Guidance for the Diagnosis, Evaluation, and Management of Infants with Possible Congenital Zika Virus Infection — United States, October 2017

EVALUATION FOR INFANTS WITH POSSIBLE CONGENITAL ZIKA VIRUS INFECTION

Ask about possible maternal Zika virus exposure

Possible Zika virus exposure

Does infant have findings consistent with congenital Zika syndrome (CZS)?

YES

INITIAL EVALUATION
• Standard evaluation (Refer to Box 1).
• Zika virus NAT (serum and urine) and IgM (serum) testing within a few days after birth, if possible.**
• Consider Zika virus NAT and IgM testing on cerebrospinal fluid (CSF).
• Head ultrasound by 1 month of age.
• Comprehensive ophthalmologic exam by 1 month of age.
• Automated auditory brainstem response (ABR) by 1 month of age.**
• Evaluate for other causes of congenital anomalies.

Refer to developmental specialist and early intervention. Provide family support services. Consider additional consultations with specialists based on clinical findings of infant (Refer to Box 2).

NO

If no maternal Zika virus exposure is identified, routine pediatric care is recommended.

Is there laboratory evidence of maternal Zika virus infection during pregnancy?

Laboratory evidence of possible maternal Zika virus infection during pregnancy

INITIAL EVALUATION
• Standard evaluation (Refer to Box 1).
• Zika virus NAT (serum and urine) and IgM (serum) testing within a few days after birth, if possible.**
• Head ultrasound by 1 month of age.
• Comprehensive ophthalmologic exam by 1 month of age.
• Automated ABR by 1 month of age.**

Is initial evaluation normal?

NO

Laboratory evidence of congenital Zika virus infection (Refer to Table 1)

YES

No laboratory evidence of possible maternal Zika virus infection during pregnancy

Testing and clinical evaluation for congenital Zika virus beyond a standard evaluation is not routinely recommended.

• If findings suggestive of CZS are identified at any time, refer to appropriate specialists and evaluate for congenital Zika virus infection.

Is there laboratory evidence of congenital Zika virus infection? (Refer to Table 1)

Laboratory evidence of congenital Zika virus infection

• Congenital Zika virus infection is unlikely.
• Infant should continue to receive routine care, and health care providers should remain alert for any new findings of possible congenital Zika virus infection.

No laboratory evidence of congenital Zika virus infection

* Possible Zika virus exposure includes travel to, or residence in an area with mosquito-borne Zika virus transmission or sex without the use of condoms with a partner who has traveled to or resides in an area with mosquito-borne Zika virus transmission

** Laboratory evidence of possible Zika virus infection during pregnancy is defined as 1) Zika virus infection detected by a Zika virus RNA NAT on any maternal, placental, or fetal specimen (referred to as NAT-confirmed), or 2) diagnosis of Zika virus infection, timing of infection cannot be determined or unspecified flavivirus infection, timing of infection cannot be determined by serologic tests on a maternal specimen (i.e., positive/equivocal Zika virus IgM and Zika virus PRNT titer ≥10, regardless of dengue virus PRNT titer value; or negative Zika virus IgM, and positive or equivocal dengue virus IgM, and Zika virus PRNT titer ≥10, regardless of dengue virus PRNT titer). The use of PRNT for confirmation of Zika virus infection, including in pregnant women, is not routinely recommended in Puerto Rico (https://www.cdc.gov/zika/laboratories/lab-guidance.html)

This group includes women who were never tested during pregnancy as well as those whose test result was negative because of issues related to timing or sensitivity and specificity of the test. Because the latter issues are not easily discerned, all mothers with possible exposure to Zika virus during pregnancy who do not have laboratory evidence of possible Zika virus infection including those who tested negative with currently available technology should be considered in this group.
**Box 1: Standard Evaluation**

- Comprehensive physical exam, including growth parameters
- Developmental monitoring and screening
- Vision screening
- Newborn hearing screen at birth, preferably with automated auditory brainstem response
**Table 1: Interpreting Results**

<table>
<thead>
<tr>
<th>Nucleic acid test</th>
<th>IgM</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive</td>
<td>Any result</td>
<td>Confirmed congenital Zika virus infection</td>
</tr>
<tr>
<td>Negative</td>
<td>Nonnegative*</td>
<td>Probable congenital Zika virus infection**</td>
</tr>
<tr>
<td>Negative</td>
<td>Negative</td>
<td>Congenital virus infection unlikely</td>
</tr>
</tbody>
</table>

*Nonnegative serology terminology varies by assay and might include “positive,” “equivocal,” “presumptive positive,” or “possible positive.”

**Laboratory results should be interpreted in the context of timing of infection during pregnancy, maternal serology results, clinical findings consistent with congenital Zika syndrome, and any confirmatory testing with plaque reduction neutralization testing. A negative Zika virus plaque reduction neutralization test suggests that the infant’s Zika virus IgM test is a false positive.
**Box 2: Consultations**

**Consider for all**

- ID specialist for evaluation of other congenital infections
- Neurologist
- Ophthalmologist
- Clinical geneticist
- Early intervention and developmental specialists
- Family and supportive services [including Palliative Care]

**Possible, based on findings**

- Endocrinologist
- Lactation specialist, nutritionist, gastroenterologist, or speech or occupational therapist
- Orthopedist, physiatrist, or physical therapist
- Pulmonologist or otolaryngologist for concerns about aspiration
FOLLOW UP CARE FOR INFANTS WITHOUT BIRTH DEFECTS CONSISTENT WITH CZS BUT WHO WERE BORN TO MOTHERS WITH POSSIBLE ZIKA EXPOSURE BUT NO LAB EVIDENCE OF ZIKA VIRUS INFECTION

Testing and clinical evaluation for congenital Zika virus beyond a standard evaluation is not routinely recommended

• If findings suggestive of CZV are identified at any time, refer to appropriate specialists and evaluate for congenital Zika virus infection
**Bright Futures Periodicity Schedule**

Maternal depression screening
Newborn blood testing in hospital

FOLLOW UP CARE
FOR INFANTS WITHOUT BIRTH DEFECTS CONSISTENT WITH CZS
BUT WHO WERE BORN TO MOTHERS WITH LAB EVIDENCE OF ZIKA
VIRUS INFECTION

After initial evaluation consisting of standard evaluation, eye exam, ABR testing, refer to specialists as needed....

• Infants who test positive for Zika virus infection:
  – Should receive care consistent with recommendations for infants with clinical findings, even if there are no clinically apparent abnormalities
**Follow Up Care**

For Infants without Birth Defects Consistent with CZS but Who Were Born to Mothers with Lab Evidence of Zika Virus Infection

After initial evaluation consisting of standard evaluation, eye exam, ABR testing...

- Infants who are tested but have no lab evidence of Zika virus infection and a normal evaluation:
  - Congenital Zika virus infection is unlikely
  - Should receive continued routine pediatric care
  - Providers should remain alert for any new findings
FOLLOW UP CARE FOR INFANTS WITH BIRTH DEFECTS CONSISTENT WITH CZS

• These infants require a multidisciplinary team and established medical home
• Families and caregivers require ongoing psychosocial assessment and support
  – Families should be empowered to be active participants in children’s monitoring and care
Follow Up Care for Infants with Birth Defects Consistent with CZS

- Refer infant and family to state or territorial Title V Children with Special Health Care Needs program for linkage to community based services and family support
  - Title V Information System: https://mchb.tvisdata.hrsa.gov/
THANK YOU!
